

Project Design Phase-II
Solution Requirements (Functional & Non-functional)

Date	26 June 2026
Team ID	
Project Name	AI Powered Customer Support Ticket
Maximum Marks	4 Marks

Functional Requirements

FR No	Requirement
FR-1	User Authentication and Login
FR-2	Customer, Contact, and Case Management
FR-3	Support Category and SLA Policy Management
FR-4	Automated Case Classification, Priority Assignment, and SLA Tracking
FR-5	AI-Generated Suggested Replies using Prompt Builder and Agentforce
FR-6	Reports and Dashboards for Monitoring Support Operations

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	The system should be easy to use for support agents, support managers, administrators, and customers without requiring extensive technical knowledge. It should provide a simple and intuitive Lightning interface, easy navigation through the AI-Powered CST System app, user-friendly Case creation forms, and clear reports and dashboards. For example, a support agent should be able to create a case, review the AI-generated reply, update the case status, and resolve the issue within a few minutes using the Salesforce Lightning interface.
NFR-2	Security	The system must protect customer information and support data from unauthorized access through role-based access control, secure user authentication, Profiles and Permission Sets, and Object-level and Field-level Security. For example, only Support Managers can modify case

		ownership, while Support Agents can update case status but cannot modify AI-generated reply fields or SLA due dates.
NFR-3	Reliability	The system should process customer support cases accurately while ensuring that no data is lost, through automatic record saving, reliable Flow execution, accurate SLA calculations, and stable cloud infrastructure. For example, when a new case is created, the system should automatically assign priority, calculate the SLA due date, and generate the AI Suggested Reply without any manual intervention, with Salesforce cloud services providing automatic backups and high reliability.
NFR-4	Performance	The system should respond quickly while handling a large number of customer support cases, ensuring fast page loading, quick Flow execution, rapid AI response generation, and efficient report generation. For example, support managers should be able to generate case reports and view dashboards within a few seconds, even when hundreds of customer cases are stored in the system.
NFR-5	Availability	The system should be accessible whenever customer support services are required, offering 24x7 availability, minimal downtime, cloud-based deployment, and reliable disaster recovery. For example, support agents should be able to access customer cases, AI-generated suggestions, and reports at any time using Salesforce's cloud platform.
NFR-6	Scalability	The system should support increasing numbers of customers, support agents, and support cases without degrading performance, by supporting more users, handling large numbers of Case records, expanding storage automatically, and maintaining system performance. For example, if the organization grows and receives thousands of customer support requests every month, the Salesforce platform should continue to process cases, AI suggestions, reports, and dashboards efficiently.
